

ABSTRACT OF THE DISCLOURE

A protecting medical-treatment chair which can generate a protective air curtain and a negative air pressure inside the chair by applying the suction and discharging effect generated by the medical level air-suction and cleaning equipment to make the user of the protecting medical-treatment chair isolated and prevent contact between the user of the chair and the air outside the chair; particularly, by applying the push and pull effect of the air flow the air exhaled by the user of the chair can be sent to the medical level air-suction and cleaning equipment for filtration and sterilization, and then the clean air are discharged from the air suction and cleaning equipment for recirculation and generating the air-curtain shield by the protecting medical-treatment chair.
